

Steps	Description	Notes/ User Input
1.TEAM	First and foremost, your team is key. You need to have technical experts who understand the logic behind AI systems and can advocate for your organization when dealing with vendors. Since HR professionals are typically experts in their field, they may not be familiar with the inner workings of HR systems, platforms, knowledge management, or how everything is structured and connected. However, to ensure that decision-making is on the right track, you must include HR professionals who grasp the logic behind technology. It is not enough to have only engineers, as they may not fully understand HR processes. You also need an HR professional involved. Additionally, someone with expertise in compliance whether an HR professional or a legal expert should be part of the team. When choosing vendors for HR AI implementation, you might consider Core.ai or Persistent AI (https://www.persistent.com/ai/).	
2.HR Systems Analysis	Second, analyze your HR systems. Where do you store employee data? How do you manage people? If you use Workday or Oracle,	

	are these platforms synchronized with other systems, such as case management tools like Salesforce or ServiceNow? Before designing what your HR AI bot will do, someone needs to assess these platforms to maximize the benefits of AI. You do not want to find yourself in a situation where you expect the bot to provide employees with answers about policies and procedures, only to be told that integration is not possible. This step is crucial for many reasons. The cost efficiency is one, but more importantly, improving the employee experience and taking it to an exceptional level.	
3.DATA	Third, focus on your data. By data, I mean all the knowledge bases, standards, and procedural information within your organization. You must organize this data. For an AI bot to be reliable and effective, the underlying data must be structured, consistent, and up to date. This is a significant workload for HR professionals, but it is a crucial step for a successful HR AI implementation.	
4. Project Design	In this section, outline what you want your bot to do. Define your non-negotiable	

	the essential features and include additional wish-list features. From my experience, it is important to remain flexible. Along the way, you may discover that some features are not feasible, while others may be easier to implement and could enhance the employee experience. Be creative with the list, everything your team wants the bot to accomplish.	
5. Project Management	When planning the project timeline, I don't know anything about designing the projects, but I recognise the importance of clear communication about timeframes with all stakeholders. That is why I am including this as a key consideration. You want this project to be successful and completed on time. There are three phases in Machine Learning: training, validation, and testing. For this, you will likely need around six months, though the exact duration will depend on your vendors and the size of your organization.	
6.How to Measure the Success of the HR AI Bot	Once everything is in place, leverage internal stakeholders and, later, employees to evaluate the impact of the	

	implementation. Here are some key metrics I recommend: 1. Ticket Reduction. Analyse the percentage of HR support tickets reduced due to the AI bot. 2. User Adoption. Measure the percentage of HR transactions initiated through the bot. This metric will depend on the specific functions you have assigned to your AI bot. Please feel free to contact me if you need assistance with defining metrics or anything regarding with HR AI implementation. I am happy to help and problem solve together.
