Introduction

You might not need to buy another new AI system. In many cases, AI can be integrated with the systems that your organisation already uses. Sometimes building your own AI solution, tailored to your needs, is the most effective approach.

In this e-book, you will find practical examples of how AI can be applied within HR teams, as well as key considerations before implementation. You will learn:

- Where AI can add the most value in HR.
- What steps are required to prepare your organisation for AI adoption.
- How to evaluate options and start the journey effectively.

Practical Examples of AI in HR

1. HR Chatbots

- Answer FAQs instantly, providing employees with information in seconds instead of days.
- Support HR transactions and searches using the organisation's knowledge base.
- Reduce HR ticket volume by being available 24/7.

2. Performance Management

- AI can assist in writing and structuring performance reviews.
- Analyse performance data to identify strengths, trends, or issues early.

3. HR Process Support

- AI can read policies and procedures across systems and documents to assist HR professionals.
- This reduces time spent on manual searches and increases overall productivity.

4. HR Transactions

- Automate routine transactions such as booking annual leave, updating employee records, and processing requests.

5. Onboarding

- Automated workflows: Trigger tasks, send documents, and schedule training sessions.
- Virtual assistants: Guide new employees through policies, forms, and tools.
- Knowledge base support: Provide instant answers to onboarding questions.

6. Personalised Development

- AI can recommend training based on role, performance gaps, and career goals.

7. Employee Feedback and Sentiment Analysis

- Analyse internal surveys and feedback to monitor morale and satisfaction.
- Generate action plans for improving engagement in real time.

8. Workforce Planning

- Attrition prediction: Forecast potential resignations using behavioural and historical data.
- Talent analytics: Identify workforce gaps, succession planning needs, and emerging leaders.

9. Learning and Development

- Adaptive learning: Personalised paths tailored to employee goals and progress.
- Skill gap analysis: Map current skills and suggest relevant courses.

10. Payroll and Benefits

- Automated processing: Validate payroll data, detect anomalies, and ensure compliance.
- Benefits optimisation: Help employees choose the best packages based on personal needs.

11. Employee Engagement and Retention

- Pulse surveys: Analyse frequent feedback to detect trends and areas for improvement.
- Chatbots for support: Provide employees with quick answers anytime.
- Wellbeing monitoring: Detect potential burnout or stress through activity and communication analysis.

12. Compliance and Risk Management

- Policy enforcement: Monitor adherence to company rules and regulations.
- Document management: Classify, track, and retrieve compliance records efficiently.
- Regulatory updates: Use AI to track labour law changes and suggest updates.

13. Hiring and Recruitment

- Redesign job descriptions based on real data.
- Continuously update requirements to avoid outdated criteria.
- Assist in identifying top talent more efficiently.

Key Considerations Before Implementing AI in HR

1. Data Preparation

- Clean and update HR documentation.
- Ensure data consistency: one format, one template, consistent fonts.
- Use structured paragraphs and clear section titles to make content more “AI-friendly.”

All your data and HR documentation must be updated and organized in one place that integrates well with the AI system. This is the most time-consuming task, but without it, AI will be useless. Consistency is key. Ensure that all HR documentation follows the same format that works well with AI. Using the same font throughout a document is best, and applying the same template across all documents is even better. Paragraphs are preferable to tables. Whenever possible, write content in paragraphs to make it more suitable for AI. Create section headers to provide structure. Add titles to paragraphs by increasing the font size and applying bold or larger fonts to help the AI understand the section.

2. System Review

- Reevaluate your current HR systems.
- Retire outdated tools and focus on systems that integrate well with AI.
- Ideally, consolidate into:
 - One knowledge system (HR knowledge base).
 - One ticketing system (employee and team interactions).
 - One data system (metrics, analytics, and monitoring).

Think about what systems you use and for what purposes. Identify what can be removed, what no longer serves you, and what can work well with the AI system. The goal is to have as many systems as needed, but not more than that. For example, one knowledge system where you store all HR information, one ticketing system for communication with other teams and employees, and one system for monitoring employee metrics. Reevaluate what the organization already has and consider integrating AI into the existing systems.

Choosing the Right AI Option

When considering AI for HR, look beyond HR alone. Think about your company's overall IT infrastructure:

- Microsoft Azure Cloud (Office 365, OneDrive, enterprise apps).
- Amazon Web Services (AWS).
- Google Cloud Platform (GCP).
- Oracle Cloud, IBM Cloud, Alibaba Cloud, and others.

Work closely with your IT or technology teams to understand:

- Existing contracts and providers.
- What AI solutions can be integrated with current systems.

For example, platforms such as Core.ai can integrate AI into enterprise systems.

Bring stakeholders together, organise focus groups, collect pros and cons, and analyse data. The more informed your decision, the better the outcome.

Conclusion

AI is not a replacement for HR professionals—it is a powerful tool to empower them. By automating repetitive tasks, supporting decision-making, and enhancing employee experience, AI allows HR leaders to focus on what matters most: people.

This e-book has provided examples, considerations, and options to help you start. The journey to AI in HR is not about technology alone—it is about making smarter choices that serve your organisation's people and culture.
